Hello! My name is Cash Hilinski and I am super super passionate about making positive change with technology in my community but why stop there? My plan is to make positive change with technology in every community across the globe. Currently, I am taking action with this passion by creating platforms like Humanitybridge. Humanitybridge connects aspiring volunteers with non-profit organizations around the globe. Currently the site averages 1-2k users monthly, hosts organizations in 150+ countries and has connected an estimated 10 thousand volunteers to missions around the world. In the future, I want to expand this into a hub that volunteers can use to connect with every community around the globe. Additionally, I have drafted policies aimed to garner more funding for underprivileged schools in my area to create STEM programs and I plan to propose them to my counties officials.

I grew up volunteering and I always felt a really deep connection with my community. Helping my community was consistently the greatest part of my day. and When I discovered computer programming I knew that it could help benefit my communities and many others. (if you have time just yap)

I plan to pursue my bachelors degree in Computer Engineering for this very reason so I can learn more about this beautiful technology that I have been able to help people in my community and many others. With these new found skills I will continue to pursue making a positive impact on my community.

Unironically I found this scholarship because of my love for tacobell. Me and my friend were eating grilled cheese burritos when we overheard the staff talking about it. So here I am! Thank you!
